

Fork Positioner for Forklifts

Fork Positioner for Forklift - A fork positioner is actually a device made out of high quality materials meant to endure the most demanding procedures and work environments. This piece of equipment enables drivers to be able to work the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate more precise carrying and placement in a quicker and much more efficient manner.

The unique fork pocket design could enable the one operating it to safely sway the unit's blades without any worry of damaging the positioning cylinders. This can allow the operator the choice to either execute independent or simultaneous blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into fork positioners on available units.
